

## **HGI Industries Announces Introduction of Advanced Odorox® MVP™ Systems**

*Company Established Technology Leadership in Remediation Industry*

**Boynton Beach, FL, February 11, 2011 – HGI Industries, Inc.**, a private technology company, announced the introduction of its advanced Odorox® MVP™ systems featuring integrated optics and computerized active process controls, which enable dynamic system control and optimization. HGI engineers can monitor integrated systems to adjust parameters and trouble shoot Odorox® MVP™ systems remotely. These new systems generate atmospheric hydroxyl radicals with greater reactivity and longevity enabling more effective treatment of even very large indoor spaces.

The introduction of these advanced features enables the use of HGI systems in applications beyond traditional remediation as clients implement programs in hospitality, nursing homes, hospitals, kennels, stables and more. To support these programs HGI Industries has initiated comprehensive animal clinical studies to evaluate the effects of prolonged indoor exposure to atmospheric hydroxyls – if any. These studies would be the first conducted, as government regulatory agencies consider the production and use of atmospheric hydroxyls as safe and do not regulate their use. Additionally, HGI is developing new analytical methods to measure the concentration of atmospheric hydroxyls – a challenge because they are so short lived. Traditional devices and laboratory methods have not been effective since they cannot differentiate between hydroxyls and other oxidants – particularly ozone.

### **About HGI Industries, Inc.**

HGI Industries specializes in the design, development and production of “Odorox®” systems to deodorize and sanitize air and surfaces using atmospheric hydroxyl radicals generated by the power of ultraviolet irradiation on ambient water vapor. The process is the ultimate in “green” technology, since it imitates the way the Sun produces atmospheric hydroxyls in nature. There are no chemicals involved – just light and water vapor. HGI technology enables you to bring the sanitizing power of the sun indoors to sustain a purified, safe environment. The company offers comprehensive, integrated solutions to corporate clients and markets its systems in collaboration with distributors in the U.S., Canada and Latin America.
